Upgraded Study Plan: Diploma 1st Semester (EE/EEE)

28 September 2026–9 April 2027 | Exam starts: 10 April 2027 | Evening study: 6:00–10:00

1. What makes this plan stronger

This version keeps Maths as the top priority, but fixes the original plan's workload mismatch: four 50-minute slots equal 3 hours 20 minutes per day, not four full clock-hours. It also builds in recovery, timed tests, error analysis, and a clear missed-work system.

Weekly commitment	Target	Purpose
Mon–Fri	4 slots/day = 16 hr 40 min	Main learning + Maths practice
Saturday	4 slots = 3 hr 20 min	Revision and a timed test
Sunday	2 slots = 1 hr 40 min	Light revision/recovery; rest after that
Total	26 slots = 21 hr 40 min	Sustainable for 194 days

2. Weekly timetable

Each slot is 50 minutes. Take a 5-minute break between slots and a 15–20 minute break after two slots. Do not add missed work late at night; use the recovery rules instead.

Day	Slot plan	Focus
Monday	Maths ×2, Physics ×2	New Maths concept + Physics learning
Tuesday	Maths ×2, Chemistry, Technical	Maths practice + two theory/numerical subjects
Wednesday	Maths ×2, Physics, Chemistry	Maths practice + recall questions
Thursday	Maths ×2, Technical ×2	Maths + technical diagrams/numericals
Friday	Maths ×2, Chemistry ×2	Maths + Chemistry numericals/revision
Saturday	Maths error log, weekly revision, timed test, test analysis	No major new topic
Sunday	Physics/Technical revision ×2 *or* recovery slots	Stop after 2 slots; rest

Daily Maths rule

Use the first Maths slot for a concept, worked examples, or formula revision. Use the second slot only for questions. Solve at least 10 questions after every completed topic; record every wrong question in the error log.

3. Syllabus phases and milestones

Dates	Maths	Physics / Chemistry	Technical	Milestone
28 Sep–11 Oct	Basics for 3 days; then Matrices	Physics: Units, Elasticity Chem: Atomic structure, Electrochemistry	Hydro, Thermal, Nuclear, Diesel, Gas	Matrices completed by Week 2
12–25 Oct	Straight Lines; begin Trigonometry	Physics: Surface Tension, Viscosity, Heat Chem: Faraday, Cells, Metals & Alloys	Solar, Wind, Biomass, Fuel Cell	Formula notebook updated
26 Oct–8 Nov	Trigonometry	Physics: Gas Laws, Light, Laser, Sound, Photoelectric Effect, X-ray Chem: Non-metals, Environment	Economics; begin T&D;	Physics/Chemistry first coverage and Trig by Week 6
9–29 Nov (light weeks)	Differentiation—core rules and problems	Numericals + weak areas	Substation, Grid	Differentiation by Week 9; Week 11 if holidays intervene
30 Nov–20 Dec	Integration + remaining Differentiation	Targeted revision and PYQs	Targeted revision and PYQs	One full syllabus pass by Week 12
21 Dec–14 Feb (28 Dec–3 Jan buffer)	Second pass: Units 1–5 and mixed questions	Revision + past papers	Revision + past papers	Repair missed topics in buffer
15 Feb–28 Mar	Two problem-focused slots on study days	Full-paper rotation each Saturday	Full-paper rotation each Saturday	Timed papers and test analysis

Dates	Maths	Physics / Chemistry	Technical	Milestone
29 Mar–9 Apr	Weak topics + formula sheet; revision only	Final revision	Final revision	No new learning

4. Testing and revision system

Testing is useful only when it is timed, checked, and followed by repair work. Every Saturday, review the error log before starting the test.

Period	Saturday test	After-test action
Weeks 1–12	10-question topic quiz; 30–40 minutes	Correct it the same day; redo wrong questions without notes
Weeks 13–20	20 questions; 75 minutes: 10 Maths, 4 Physics, 3 Chemistry, 3 Technical	Classify each error: concept, formula, calculation, careless, or time
Weeks 21–26	One full timed paper; rotate subjects so each gets regular papers	Spend one slot analysing; schedule top two weak areas next week
Last 12 days	Short mixed quizzes only if they do not reduce revision time	Revise formulas, error log, PYQs, and weak chapters

Spaced revision rule

For every new topic: review it after **1 day**, after **1 week**, and after **3 weeks**. Each review should include closed-book recall or questions—not only rereading.

5. Recovery, tracking and wellbeing

Minimum-day rule: On a tired or busy day, complete one Maths slot plus 20 minutes of formula/error-log review. This protects consistency without forcing a late-night catch-up.

If one day is missed: Do not try to double the next day. Move only the highest-priority task to Sunday or the 28 Dec–3 Jan buffer. Maths comes first, then the nearest test topic, then other tasks.

If a full week is missed: Skip that Saturday’s test, revise the most important missed content, and restart the timetable the following Monday. Do not start a new topic until the essential backlog is controlled.

Monthly review (last Saturday of each month): Record syllabus completed, test percentage, weakest three chapters, number of missed slots, and next month’s corrective action.

Rest rule: Sunday ends after two slots. Keep one full Sunday off each month. During study slots, keep the phone away; use it only during breaks.

Final principle: aim for 80–85% completion over the full 194 days, not perfect daily completion. Consistency, timed practice, and correcting errors matter more than adding extra hours.
